

Turtles

Turtles have lived since the dinosaurs. They can live up to 80 years. They can stay under water for 5 hours. Turtles lay eggs and then leave them to hatch on their own, when they hatch they dig a hole in the sand to get out and when they get out they try to get to the water without being seen . Sea turtles prefer warmer water. Turtles eat jelly fish, sea weed, shrimp, snails, crabs, algae and sponges. By Ellen
